

Abstract

A seat assembly includes a seat cushion extending laterally between spaced apart side members. The seat cushion includes a front cross member extending between the side members. Front legs are pivotally assembled at one end to the front cross member for pivotal movement of the seat cushion relative to the front leg between a seating position and a forwardly dumped positions. A rod is connected at a first end to a spaced side member and at a second end to the front leg. The seat cushion is automatically laterally displaced relative to the front legs in response to pivotal movement of the seat cushion relative to the front legs due to changes in the effective length of the rod.
